

# Week 11 Assignment Project Exam Help

FIT5202 Big Data Processing

https://powcoder.com

#### Add WeChat powcoder

Data Streaming using Apache Kafka and Spark

Spark Structured Streaming

Aggregations on Windows over event-time

Handling Late events with water marking

#### Week 11 Agenda

- Week 10 Review
  - Structured Streamingnment Project Exam Help Integration with Kafka

  - DEMO

https://powcoder.com

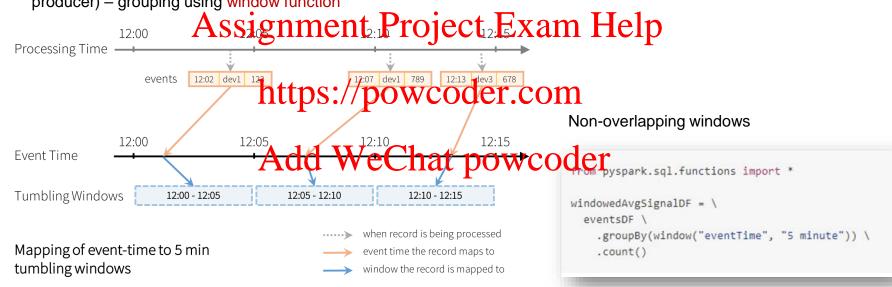

- This Week:
  - Aggregations on Windows over Event Time Handling late data with watermarking Powcoder

  - "Parquet" sink
  - Checkpointing

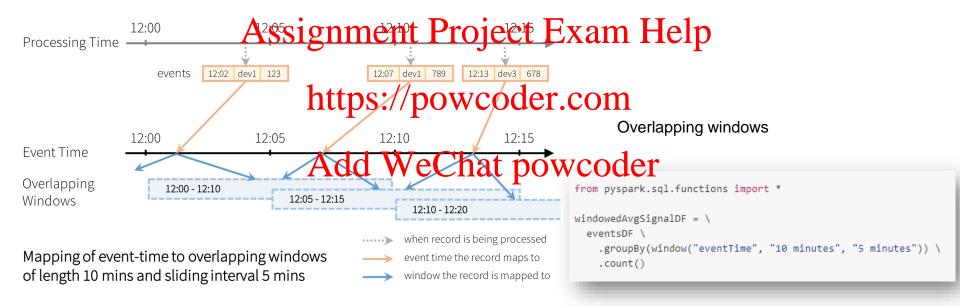

### **Aggregations on Windows over Event Time**

- In many cases (e.g., moving averaging), we want aggregations over data bucketed by time windows (e.g., every 5 minutes) rather than over entire streams
- Bucketing data into windows based on event-time (e.g. the time data generated in the producer) grouping using window function

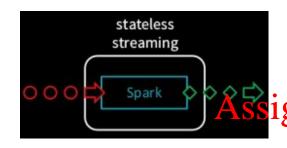

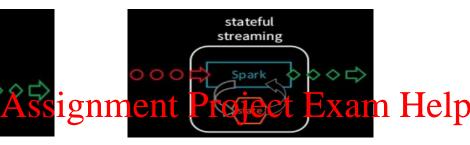

#### **Aggregations on Windows over Event Time**

#### Stateless vs Stateful Stream Processing

State of Progress

- keeping track of data that has been processed in streaming so far.
- Called checkpointing/saving of offsets of incoming data.

#### Stateless

- ☐ Each record is processed independently of other records
- e.g. operations like map, filter, join with static data

#### https://powcoder.com

- Processing of records depends

  Add Wortellesult of previous oder
  - Need to maintain "intermediate information" for processing called "state"
  - E.g., operations like aggregating count of records (e.g., intermediate count)

#### State of Data

intermediate information derived from data (processed so far).

https://medium.com/@chandanbaranwal/state-management-in-spark-structured-streaming-aaa87b6c9d31

### Watermarking

Structured Streaming can maintain the intermediate state for partial aggregates (e.g. intermediate count) for a period of time such that late data can update aggregates of old windows correctly

To handle events that arrive late to the Project Exam Help late data that was generated at 12:04 but arrived at 12:11 Input Stream 12:07 owl cat application 12:03 dog dog 12:13 E.g. a word is generated at 1 1944 (syen) / ipe) wcoder.combut received at 12:11 by the application. 12:10 12:15 12:00 - 12:10 cat 2 12:00 - 12:10 cat 1 12:00 - 12:10 cat 2 The application should use the time 12:04 12:00 - 12:10 | dog | 3 12:00 - 12:10 dog 4 instead of 12:11 to update the comtest in attention 12:00 - 12:10 owl 1 12:00 - 12:10 | owl | 1 12:05 - 12:15 cat 1 12:05 - 12:15 cat 1 a window 12:00 - 12:10. 12:05 - 12:15 | owl | 1 12:05 - 12:15 | owl | 2 12:10 - 12:20 owl 1 Watermarking lets engine automatically track counts incremented only for window 12:00 - 12:10

 Watermarking lets engine automatically track the current event time in data and clean up/update old state accordingly

Late data handling in Windowed Grouped Aggregation

## Watermarking

Two parameters to define the watermark of a query

- (1) event time column
- (2) Threshold specify for how late data should be processed (in event time).

Assignment Project Exam Help

```
max event time

12:30 PM

trailing gap
of 10 mins

watermark
12:20 PM

than
watermark
not expected
```

event time

```
withWatermark(eventTime: String, delayThreshold: String)
```

late data within the threshold will be aggregated, but oat a relation later than the threshold will start getting dropped

max event time - is the latest event time seen by the engine

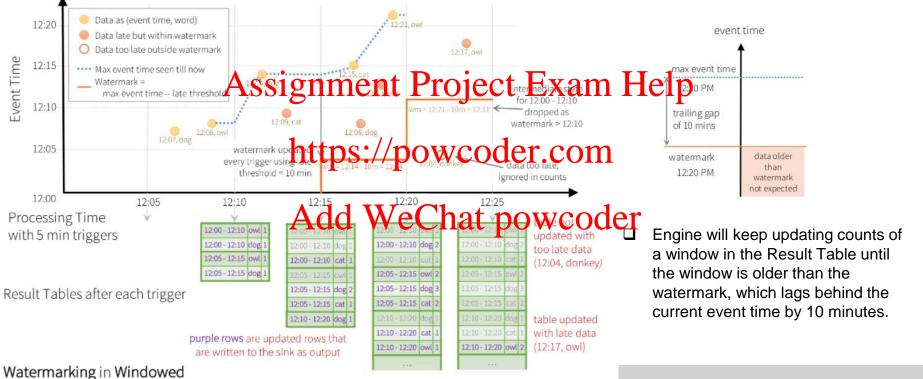

```
# Group the data by window and word and dmpte Whe Chat powcoder
windowedCounts = words \
    .withWatermark("timestamp", "10 minutes") \
    .groupBy(
        window(words.timestamp, "10 minutes", "5 minutes"),
        words.word) \
    .count()
```

### Watermarking

Window-based aggregation based on event time – Window size = 10 mins Slide = 5 mins

```
# Group the data by window and word and compute the count of each group
windowedCounts = words \
    .withWatermark("timestamp", "10 minutes") \
    .groupBy(
        window(words.timestamp, "10 minutes", "5 minutes"),
        words.word) \
    .count()
```

Grouped Aggregation with Update Mode

# Recovering from Failures with Checkpointing

- In case of failure, can recover the previous progress and state of previous quely and Project Exam Help continue where it left off.

   Can enable checkpointing using the previous project of the continuous co
- Can enable checkpointing using the option would be checkpoint Location on the query.
- To save all the progress information (i.e. range of offsets processed in each trigger Chat powcoder and the running aggregates ('states') to the checkpoint location

#### Clickstream Watermarking

Kafka producer

2021-05-20 23:46:10 impressions: 5

2021-05-20 23:46:20 impressions: 5 2021-05-20 23:46:20 impressions: 1

2021-05-20 23:46:20 impressions: 4

Late events

schema = StructType([

|-- kev: binary (nullable = true)

-- value: binary (nullable = true)

tapic: string (nullable = true)

-- timestampType: integer (nullable = true)

StructField('Clicks', IntegerType(), True),

StructField('Impressions', IntegerType(), True),

Using the schema, we convert the data to a Spark **DataFrame** 

|-- Clicks: integer (nullable = true)

|-- ts: timestamp (nullable = true)

|-- Impressions: integer (nullable = true)

df formatted.printSchema()

Clicks **Impressions** ts 6 1602944650 10 1602944650 1602944650

#### **Aggregations on Windows over Event-time**

#### Output result table

Spark subscribe to topic & read data ACC W

```
auerv = windowedCounts \
    .writeStream \
    .outputMode("complete") \
    .format("console") \
    .trigger(processingTime='5 seconds') \
    .option("truncate", "false")\
    .start()
```

```
|[2021-05-20 23:52:00, 2021-05-20 23:52:10]|124
 [2021-05-20 23:51:40, 2021-05-20 23:51:50] [138
1[2021-05-20 23:52:20, 2021-05-20 23:52:30]|40
|[2021-05-20 23:51:30, 2021-05-20 23:51:40]|85
[[2021-05-20 23:51:50, 2021-05-20 23:52:00]]134
|[2021-05-20 23:52:10. 2021-05-20 23:52:20]|133
```

.withWatermark("ts", "10 seconds") \ .groupBy(window(df\_formatted.ts, "10 seconds"))\ .agg(F.sum("Impressions").alias("total"))\ .select("window","total")

windowedCounts = df formatted \

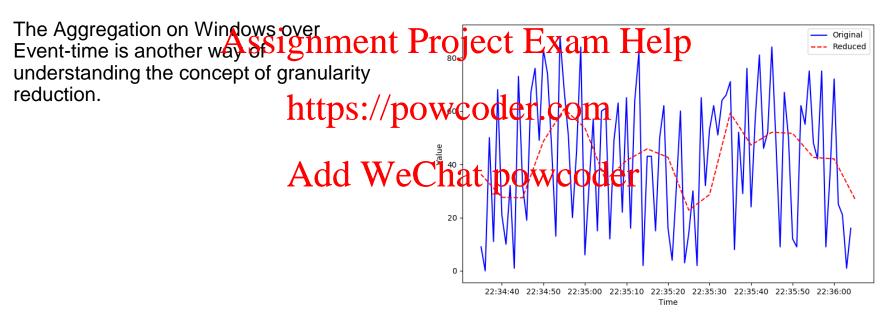

For aggregation query, use 'complete' mode

### **Granularity Reduction DEMO**

(Refer to Lecture)

Real-time uniform stream data visualization

### Lab Task: Access Log – Window-based Aggregation

Aggregations on window over event-time

tsExp=r'(\d{10})\s'
- Extract event timestamp

Each line contains some valuable information such as dd WeChat powcoder

- 1. Host
- 2. Timestamp
- 3. HTTP method
- 4. URL endpoint
- 5. Status code
- 6. Protocol
- 7. Content Size

#### Task 1

- Using the Window function, find the number of logs for each status in a window of 30 seconds. Set the window slide to 10 seconds
- Write the output to console sink.
